

Frames of the same flow do not share a spectral shape: the ensemble mean is not the right target for any individual frame

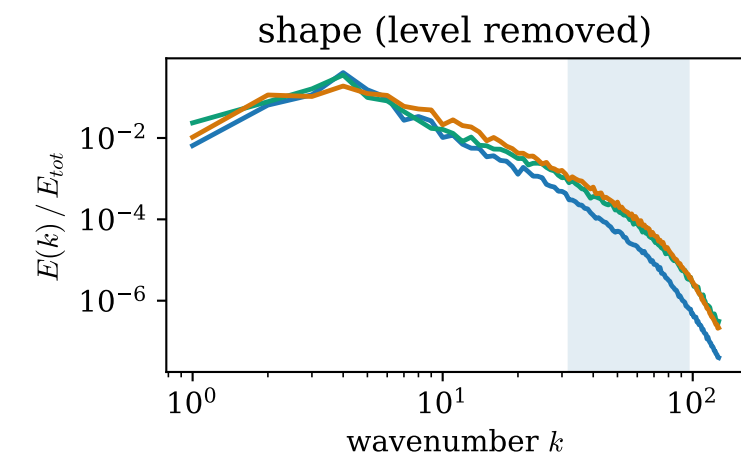

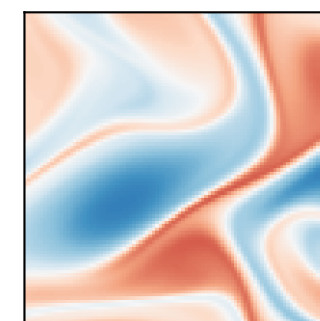

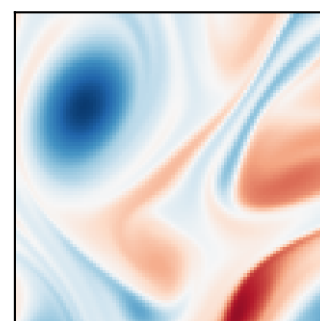

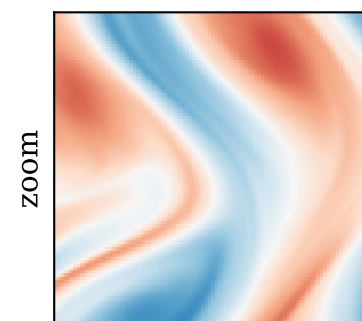

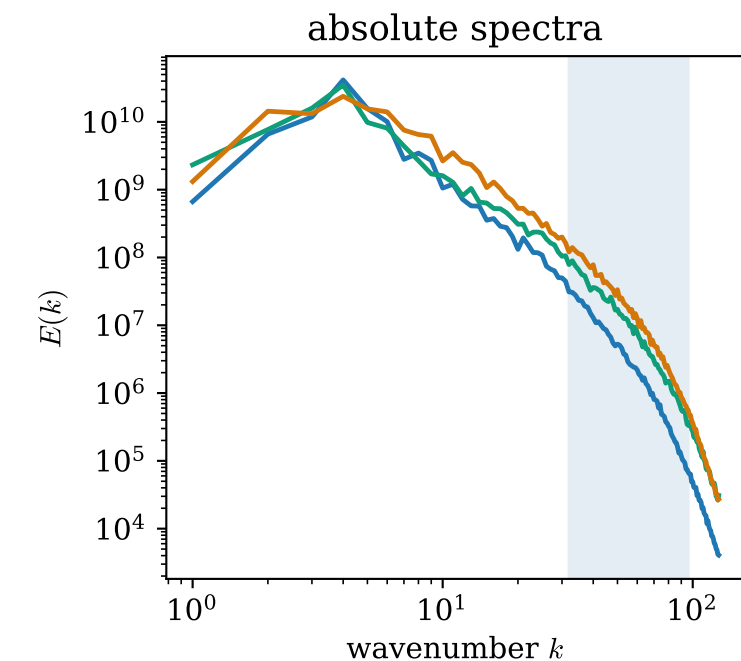

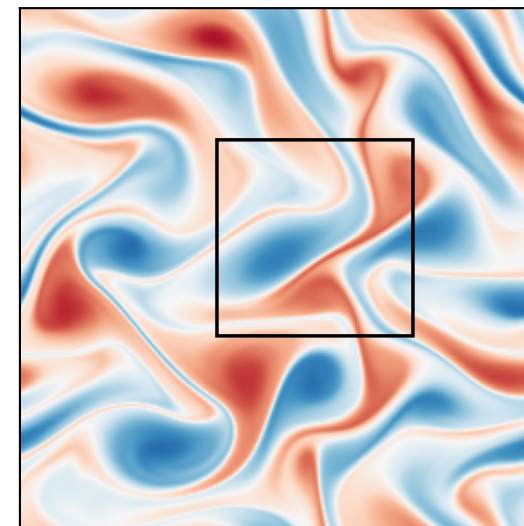

quiet frame (p10)
fine-scale energy $0.33\times$ mean

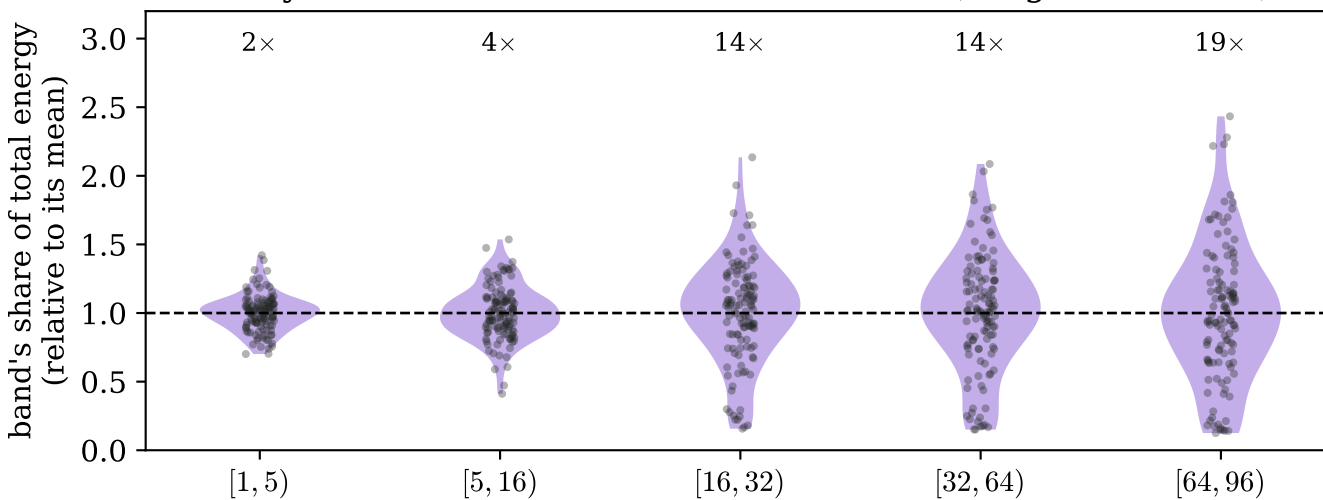

typical frame (p50)
fine-scale energy $0.95\times$ mean

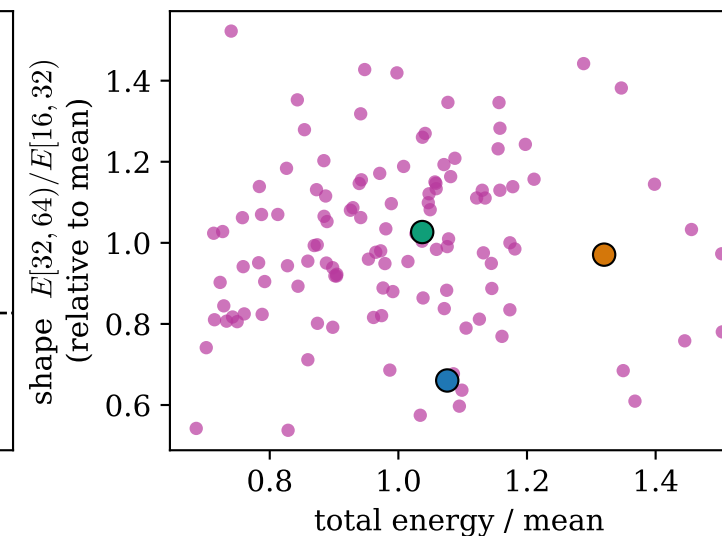

energetic frame (p90)
fine-scale energy $1.63\times$ mean

every band's share varies frame to frame (range annotated)

shape is independent of level
 $r = +0.09$

fine-scale energy across frames
spread 0.48 , range $17\times$
